## ● O&O AutoBackup 4

### Automatic synchronization of backup copies of your files and folders

O&O AutoBackup automatically synchronizes selected files and folders with an external backup device (USB Stick, external USB hard disk, FireWire volume). As an example, you can use O&O Auto backup to create a backup copy of your photo folder onto a USB stick and set it so that changes made to the original data are automatically taken into account for the next backup.

#### Here's how O&O AutoBackup works

The copy process always begins automatically after you've connected a hotplug capable disk to the computer. Using the status bar icon and status window in the program, you can see when the process is completed and remove the disk. \*

All the settings you need can be found under Default settings.

**1.** Click **Create a task** to select a file or folder as source for the copy. Alternatively, you can click the Add button and enter a source path or wildcard (such as .jpg) for certain file types by hand.

**2.** You can now select which action O&O AutoBackup should execute.

**2.1** "Copy all the source data in a directory on the destination drive." All the selected files/folders will be copied. The folder will be named after the date using a "year, month, day" format.

**2.2** "Copy all modified and new source data, no deletion of data" Files currently on the destination drive will not be recopied if they were not changed in the source. Only modified and new files/folders will be copied onto the destination drive. As opposed to point 2.3, no data will be deleted on the destination drive.

**2.3** "Perform synchronization, i.e., apply all changes and file deletions." All files and folders in the source will be copied onto the external disk. As opposed to point 2.2, files/folders that were deleted on the source will also be deleted on the destination drive. Once the action is completed, the destination drive is essentially a mirror image of the source data/folder(s).
