

Maximum data security!

Prevent data loss easily and securely! With O&O DiskImage 4 you can create images of your entire computer or individual partitions during operation. If data loss occurs, your imaged data (files, folders, partitions) will be available to you in no time with just a few clicks - even if Windows cannot be started anymore!

Differences to previous version

Besides the continuous maintenance and enhancement of the existing program components, you will find several additional new and helpful features in Version 4. For example, the new interactive DiskView offers a complete overview of the entire hard disk. Free and used space, as well as the size of the individual partitions are displayed. Managing your data will be greatly facilitated. The new additional compression process BZIP2 compresses data in blocks thus increasing the rate of compression. In addition it is also possible to convert images into virtual drives (VHD) and to include them directly to the Microsoft Virtual PC – without previous installation of O&O DiskImage.

Prevent data loss with time-scheduled imaging

With the help of a useful Wizard you can set that the data will be imaged regularly at predefined times. Differential and incremental images can now also be created automatically.

Exclusive methods for data backup

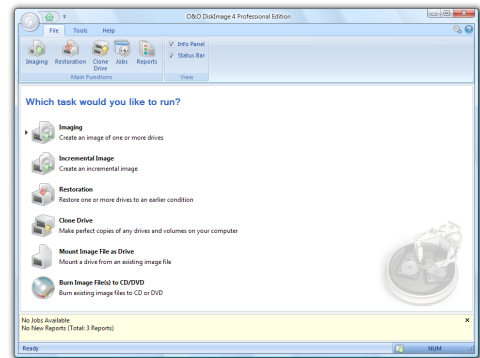

In addition to a scheduler, O&O DiskImage offers different imaging methods. With the complete imaging option, you can choose between a space-saving used sector image and an all-encompassing forensic image for the purposes of a data recovery – for example when using products from the award-winning O&O RescueBox. You save space with an incremental or differential image: Only data sectors which have changed will be imaged.

Quick and convenient restoration

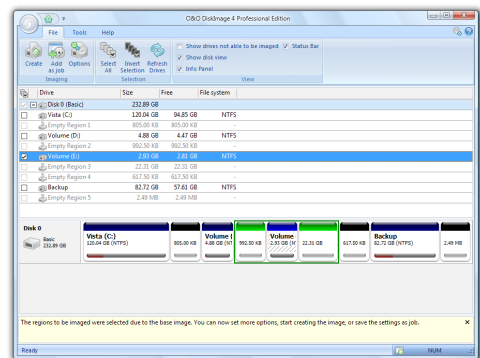

Our BareMetal technology enables you to immediately restore a system using O&O DiskImage without you having to previously install it. The included and bootable CD is based on Microsoft Windows and contains all standard drivers of Windows, so that most of the systems do not need to include own drivers. In addition, more drivers can be installed with the help of a Wizard whether for Controller or network cards. The Start CD also includes various system rescue tools.

Restore individual files

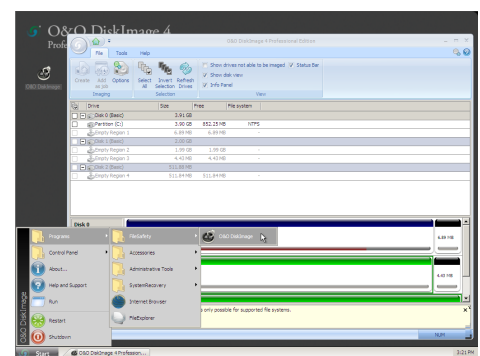

Both full and incremental images can be mounted as virtual drives. This enables you to directly access individual files or folders, without having to restore the whole image. The virtually imaged drive behaves like a real one but is protected and cannot be overwritten.

Convert images and virtual hard disks

Made in Germany. Made in Berlin.

O&O DiskImage is available in three versions: The professional version is meant for private users, the Workstation and the Server Edition for Administrators. All O&O products are developed and maintained in Berlin. More information can be found in on our Homepage www.oo-software.com.

Highlights:

- NEW: DiskView – Graphical overview of the hard disk
- NEW: Additional compression type (BZIP)
- NEW: Enhanced burn function of CD/DVD/Blu-Ray/HD-DVD
- NEW: Handling of Microsoft Virtual PC Disks (VHD)
- NEW: TrayIcon to provide information on service and job status
- Also creates system partition images during operation
- 1:1 copies of drives (clone)
- Start CD with base operating system and system rescue tools
- and much, much more

System Requirements:

- Minimum requirement of each operating system
- 512 MB RAM (1 GB RAM for Boot CD)
- 30 MB free hard disc space
- 32-bit/64-bit support
- Windows® 7, Vista®, XP and 2000 Pro (all Editions)
