O&O VisualDisk: Understand and optimize, hard drive's write accesses

VisualDisk gives you a clear representation of the write accesses to your hard drive, as they occur on flash-based storage media such as SSDs and NVMe drives. This innovative feature shows you how defragmentation can help reduce future write accesses and extend the life of your SSDs. You get a clear picture of how your hard drive is working and how you can optimize its performance through targeted measures. O&O VisualDisk helps you get the most out of your drives and protect them from unnecessary wear and tear – for a long-lasting and fast system!

Support for the new ARM Platform!

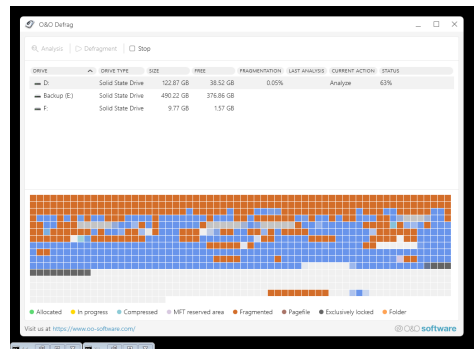

O&O Defrag 29 now supports the family of computer processors based on the ARM (Advanced RISC Machine) architecture, known for their simplicity and efficiency. This platform offers excellent energy efficiency, mobile device expertise and support for multiple operating systems. O&O Software is committed to offering you a guarantee of compatibility on old and new platforms.

Benefits of a clearly laid out hard disk

Whenever it saves data, Windows scatters file fragments all over the hard disk and this slows down access times considerably. Defragmentation reverses this by rearranging data and speeding up access times dramatically. This not only saves the user time, it also reduces wear on hard disks and extends their life expectancy. Defragmentation can even make the difference if you lose important data because chances of full recovery are better on a defragmented disk. Why? After defragmentation, it's easier for data recovery software such as O&O DiskRecovery to restore files when they're not scattered across multiple areas of a hard disk.

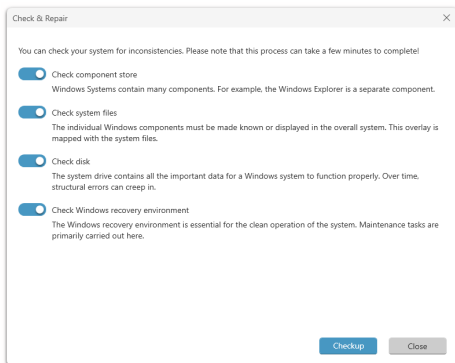

Recommended use

We recommend manual defragmentation for PCs that are being used heavily because only a user can decide when the time is right to give up the performance needed for running defragmentation. On computers using video editing or graphics applications, O&O Defrag can be configured to not start automatic optimization while certain programs are running. The default settings in O&O Defrag are more than adequate for ordinary desktop PCs running mainly internet or office applications. O&O Defrag is also perfect for notebooks. Whenever an external power supply is disconnected, O&O Defrag automatically goes into pause mode to save energy.
